Antibiotics for pink eye When you need them—and when you don't

Pink eye is a common condition, especially in children. It is also called conjunctivitis. The eyes are pink because they are infected or irritated. They may be itchy and teary, with a watery discharge, and swollen, crusty eyelids.

Doctors often prescribe antibiotic eye drops or ointments for pink eye. But antibiotics don't usually help, according to the American Academy of Ophthalmology. They can do more harm than good. Here's why:

Antibiotics are not usually necessary for pink eye.

Pink eye can be caused by a virus, an allergy, or bacteria.

Pink eye is usually caused by a virus. Viral pink eye usually goes away on its own in a week or so. Antibiotics do not kill viruses.

Pink eye can also be an allergic reaction to something like pollen, dust mites, pets, contact lenses, or cosmetics. This kind of pink

eye gets better when you avoid the things that are causing the allergy. Antibiotics don't help allergies.

A third type of pink eye is caused by bacteria. This can be helped by an antibiotic. Mild bacterial pink eye almost always goes away within 10 days, without taking medicine.

Antibiotics can cause problems.

Antibiotics can cause itching, stinging, burning, swelling, and redness. They can cause more discharge. And they can cause allergic reactions in some people.

Antibiotics can be a waste of money.

Generic antibiotic drops and ointments can cost as much as \$60. For newer, brand name drugs, you can pay over \$130. And if you have an antibiotic-resistant infection, you will need more doctor visits and costly medicines. Antibiotic-resistant infections are caused by taking antibiotics when you don't need them.

Who should use antibiotics for pink eye?

You might need antibiotic eye drops and ointments for bacterial pink eye if:

- Your symptoms are severe.
- Your immune system is weak. This might happen if you have another illness.
- Your infection does not get better in a week without treatment.

Know the symptoms of different kinds of pink eye.

- **Viral pink eye:** Symptoms can include watery eyes along with a cold, flu, or sore throat.
- **Allergic pink eye:** Symptoms include itchy eyes, swollen eyelids and a runny or itchy nose. It is more common in people who have other allergies, such as hay fever or asthma.
- **Bacterial pink eye:** Symptoms include a thick, often yellow-green discharge that lasts all day (usually not with a cold or flu).
